General Description

The Inbal Pressure Reducing Valve series 700D-01R01 is specifically designed for pressure regulating applications in fire protection systems. The Inbal 700D-01R01 Valve automatically reduces a higher inlet pressure to a preset delivery pressure, which remains steady and unaffected by the variations or fluctuations in the inlet line pressure.

The series 700D-01R01 consists of the Inbal Valve which is a pressure operated, sleeve actuated, axial valve and a pressure reducing pilot control. The Inbal Pressure Reducing Valve maintains the downstream pressure within a narrow pressure range. If the downstream pressure changes slightly the pilot control responds immediately to modulate the Inbal Valve for the preset pressure.

The use of the Inbal Pressure Reducing Valve balances the distribution of the water capacity available throughout the system and prevents a higher demand from the areas which are of lower altitude or are located closer to the pressure source. Thus, the total system demand is balanced and the excess flow through the system with high pressure water supplies is reduced to the desired level. The adjustment of the delivery pressure could be easily modified at the site.

Standard material Inbal Pressure Reducing Valves are rated to 300 psi and are available in sizes 1½” (40 mm) to 12” (300 mm) with threaded, flanged, and wafer ends.

Technical Data

Approvals
The basic Inbal Valve is approved in sizes 3” (80 mm) to 8” (200 mm) by FM as an automatic water control valve to 300 psi (21 bar). Inbal Valves series 700 are Lloyd’s, DNV, and ABS Type approved in sizes 1½” (40 mm) to 12” (300 mm) to 300 psi (21 bar).

Model Numbers

Sizes

Threaded End: 1½”, 2”, 2½”, & 3” (40, 50, 65, & 80 mm).
Flanged End: 2”, 3”, 4”, 6”, 8”, 10”, & 12” (50, 80, 100, 150, 200, 250, & 300 mm).
Wafer End: 3”, 4”, 6”, 8”, 10”, & 12” (80, 100, 150, 200, 250, & 300 mm).

End Standards

Threaded End: NPT or BSPT.
Flanged End: ANSI B16.5 class 150 & 300; ISO 7005 - PN 10, 16 & 25; BS 10 Table D & E; AS 2129 Table D & E; Jis B2212, 2213 & 2214.
Wafer End: Fits most of the above standards.

Pressure Rating

Maximum working pressure*: 300 psi (21 bar).

* Standard material valve.

Adjustment Range

Standard*
30 to 300 psi (2 to 21 bar).

* Marked red.

Temperature Range

Water: Max. +150°F (+65°C).
Installation Position
Vertical or horizontal.

Materials

Standard
Valve Housing:
Carbon Steel (SAE 1021).
Valve Ends:
Ductile Iron (ASTM A536-65 45 12).
Sleeve:
SMR5 Elastomer reinforced with Poly-}
ester and Kevlar.
Control Trim:
Brass Nickel Chrome plated, Stainless
Steel.

Optional
Cast Steel ;
Bronze ;
Nickel Aluminum Bronze ;
Stainless Steel AISI 316 ;
Super Austenitic Stainless Steel ;
Super Duplex Stainless Steel ;
Titanium.

* The standard for each optional material is
available upon request.

Coating

Standard
Powder epoxy coated. Thickness: 0.004”
(0.1 mm) external and internal surfaces.

Optional
High built epoxy coated and polyure-
thane finish. Thickness: 0.01”(0.3 mm).
Halar® coated. Thickness: 0.02”
(0.5 mm).

Halar® is a registered trade mark of Ausimont USA Inc.

Features

! No Moving Mechanical Parts
(N.M.M.P.) design provides imme-
diate and accurate response to small
pressure changes.
! The Inbal Valve has excellent
regulating performance, provides
stable delivery pressure even at the
demand of a single fused sprinkler
head, and a gradual closure in case of
increasing delivery pressure to
eliminate surges.
! Balanced single seat design pilot
control for very accurate performance-
not affected, even slightly, by inlet
pressure fluctuations.
! Long spring design pilot valve for
sensitive setting and maintaining
precise delivery pressure.
! Easily adjusted to the desired maxi-
mum system pressure.
! Hydrodynamically designed Inbal
Valve with streamline flow path
provides increased flow capacity.
! Pressure rating to 300 psi (21 bar) for
standard material valve.
! Wide range of sizes for an optimal
system design.
! Emergency Release Valve, Strainer,
Shutoff Valve, and Check Valve are
standard items.
! Water Supply Unit provides for neat,
space saving control trim.
! Control trim made of high grade
materials as standard.
! Epoxy coating supplied as standard-
ensures excellent corrosion resistance.
! Variety of available materials to ensure
corrosion-free service even under
severe conditions.
! Additional functions of various types
of deluge control could be easily added
on the same valve body.

Operation

The Inbal Pressure Reducing Valve
series 700D-01R01 is a pilot operated
hydraulic valve. The pilot system
controls the Inbal Valve Control
Chamber which is the annular space
between the valve Housing and the
Sleeve. The Pilot Valve controls the
pressure in the Inbal Valve Control
Chamber in response to changes in the
downstream pressure.

When the delivery pressure decreases,
the Pilot Valve and the Inbal Valve open
wider to increase the pressure [See
Figure (1)]. When the delivery pressure
increases, the Pilot Valve and the Inbal
Valve close to throttle further the flow
and consequently the delivery pressure is
decreased [See Figure (3)]. Thus, the
outlet pressure is maintained within a
close limit. If the inlet pressure drops to
the preset outlet pressure level, the pilot
control allows the Inbal Valve to open
wide for a minimal pressure drop across
the valve. The adjustment of the delivery
pressure is made by the adjustment screw
on the Pilot Valve.
Control Trim

The control trim includes Pilot Valve, accessories, gauges, fittings, and tubing. The trim is supplied preassembled in sections. The system is fully hydraulically tested and set on standard (unless otherwise required) to 100 psi (7 bar). The control trim includes the following components:

- Pressure Reducing Pilot Valve
- Water Supply Unit
- Restriction Orifice
- Emergency Release Valve
- Pressure Gauges and Pressure Gauge Valves

Valve Sizing

To extend the life span of the Inbal Pressure Reducing Valve it is recommended to calculate cavitation conditions at the given outlet / inlet pressure ratio. Refer to the Inbal Valve Sizing bulletin F50-01-01.

Installation

Refer to the Trim Chart applicable to the Inbal Pressure Reducing Valve model in use. The valve must be installed in an area not subject to freezing temperatures or physical damage. The Inbal Valve series 700D-01R01 can be installed horizontally or vertically.

1. When the Inbal Pressure Reducing Valve is delivered, carefully unpack and check that there has been no damage to the operating components, piping, and fittings.
2. Verify that the factory presetting is correct or alternatively that the spring type is within the desired pressure setting. See Adjustment Range in Technical Data.
3. Always flush the pipeline before installing the Inbal Valve.
4. Place the Inbal Valve in the piping. Verify that the arrow on the Inbal Pressure Reducing Valve matches the actual flow direction. Determine which side the system will be accessed from and locate the valve accordingly.
5. Install the Inbal Valve in the pipeline. Use tape, gaskets, bolts, stud bolts, bolt sleeves, and nuts as required by the specific Inbal Valve model.
6. Complete the trim assembly by mounting the preassembled sections. Refer to the applicable Trim Chart and Installation Guide.
7. Connect the drain port of the Pressure Reducing Pilot Valve to the drainage system.
8. Open the Shutoff Valve. To ensure smooth operation, all air must be expelled from the Inbal Valve Control Chamber and Pilot Control System.
9. A pressure relief valve not less than 1/2” in size shall be installed downstream of the Inbal Pressure Reducing Valve. The pressure relief valve shall be set to 15 psi (1 bar) higher than the Inbal Pressure Reducing Valve’s setting.
10. The downstream pressure adjustment is recommended at a minimum flow velocity of 1.5 ft/sec (0.5 m/sec). For preaction and wet systems, open the main drain. For deluge systems, when it is not feasible to flow the system, close the system shutoff valve and open the drain valve.
11. Operate the system to establish the minimum flow. Check the Downstream Pressure Gauge reading. If adjustment is required, turn the Pilot Valve adjustment screw clockwise to increase pressure or counter clockwise to decrease the pressure setting.
12. For a wet system, close the main drain. For a preaction system close the Water Supply Valve, verify that the system is properly drained, and close the main drain. For a deluge system, open the system shutoff valve and close the drain valve.
Pressure Reducing Valve
Series 700D-01R01

Resetting

1. In a normal course of operation, the Inbal Pressure Reducing Valve is automatically reset after operation.
2. If the Inbal Valve was actuated by the Emergency Release Valve, the handle of the L-port ball valve should be returned to the SET position.
3. If the delivery pressure should be adjusted, turn the Pilot Valve adjusting screw clockwise to increase the setting and counter clockwise to reduce the delivery pressure setting.

Strainer Cleaning

A quarterly Strainer Cleaning is recommended:
1. Close the Shutoff Valve device in the Water Supply Unit by turning the Rotor to MAINTENANCE position.
2. Remove the cover of the strainer device in the Water Supply Unit, clean if necessary. Reinstall the screen and the cover.
3. Open the Shutoff Valve device by returning the Rotor to SET position.

Valve Testing

A semi-annual Pressure Reducing Valve Testing is recommended:
If the Inbal Pressure Reducing Valve Testing is combined with the periodical testing of the whole system:
1. Check the Upstream and Downstream Pressure Gauge readings. Verify that the delivery pressure is as predetermined.
2. Record the actual flow rate and upstream and downstream pressures.

For an independent Inbal Pressure Reducing Valve Testing:
1. Perform steps (11), (12), and (13) in Installation. Verify that the delivery pressure is as predetermined.
2. Record the actual flow rate and upstream and downstream pressures.

Maintenance, Inspection, & Testing

It is recommended that periodic inspections and tests be conducted by qualified personnel to ensure that the Inbal Pressure Reducing Valve is in good operating condition.
The inspections and testing activities should be done according to NFPA standards, the guidelines and regulations of the authorities having jurisdiction, and the following instructions. It is recommended that the Inbal Pressure Reducing Valve be tested, operated, cleaned, and inspected at least on a routine basis.

Inspection

A monthly Inspection is recommended:
1. Check the Upstream and Downstream Pressure Gauge readings.
2. Verify that the Emergency Release Valve is in SET position.
3. Verify that the Shutoff Valve device in the Water Supply Unit is in SET position.
4. Visually inspect for broken or missing parts or other evidence of impaired protection.

Pilot Valve Testing

Operation of the Inbal Pilot Valve should be made quarterly. If operation of the whole system is not feasible, then an individual Pilot Valve Testing should be performed.
Testing of the Pilot Valve should be done according to the instructions in bulletin F36-02-01 - Pressure Reducing Pilot Valve models PA1 and PB1.

Removal

To remove the Inbal Pressure Reducing valve:
2. Close the Shutoff Valve device in the Water Supply Unit (turn the Rotor to MAINTENANCE position).
3. Open the Emergency Release Valve to release the water pressure from the Inbal Valve Control Chamber.
4. Remove the Inbal Pressure Reducing Valve from the line for inspection.
5. To reinstall, follow the installation procedure (use new gaskets for flanged or wafer valve).

Inquiries/Orders

The Data Sheet For Inquiries/Orders (bulletin F01-05-01) should be submitted.
